

Tickz vs Quotex: A Fair Side-by-Side

Tickz vs Quotex 2026 — an honest side-by-side of features, apps, deposits and trust signals to help traders choose between the two platforms.

Joel Whitfield, Markets Editor · 05.04.2026

TL;DR Tickz and Quotex both center on fixed-time trading from a phone, but they sit at different stages of life. Quotex is the more established name, with a longer public track record and a large existing user base. Tickz is newer, part of the EOLabs family, built mobile-first with a free demo, a low minimum deposit, KYC verification, card and e-wallet funding, and referral features. Neither platform is presented here with invented payout rates or licence numbers. Beginners who want a simple, low-cost, app-led start may find Tickz a comfortable entry point. Traders who weight the longest history and the bigger community more heavily may lean toward Quotex. Both carry the normal risk of losing money on short-duration trades, so a demo-first approach makes sense either way.

Comparison Approach

Comparing these two fairly means judging the same things on both sides: products, apps, funding, verification and track record. Maturity differs sharply between them, so this guide treats newness as a factor rather than a fault.

A like-for-like comparison only works when both platforms are measured against identical criteria. Tickz and Quotex occupy the same broad category of fixed-time and short-duration trading apps, which makes them directly comparable on features. They are not comparable on history, because Quotex has been operating publicly for far longer and Tickz has a short track record. Rather than hide that gap, this page names it and lets readers weigh it.

The criteria used here are deliberately practical, focused on what a new trader actually touches in the first month:

- **Products:** what you can trade and how the contracts work
- **Apps and usability:** how the mobile experience feels day to day
- **Funding:** deposit methods, minimums and withdrawal flow
- **Verification:** the KYC steps before live trading
- **Track record and trust signals:** how proven each brand is

Two ground rules apply throughout. First, no invented numbers: where a precise payout rate, fee or licence detail is not publicly confirmed, this guide uses plain language instead of a fabricated figure. Second, newness is described, not punished. A young platform can still be legitimate; it simply has less public evidence behind it. Readers should confirm current details on each platform's official pages for their own country before depositing, because availability and product mixes vary by region.

It also helps to be clear about what this comparison is not. It is not a ranking that crowns one app for everyone, and it makes no claim that either platform was tested with real deposits. The

work here is an evidence-and-checklist review that lines up published features, applies the same standards to both, and flags where the public record is thin. For a brand as young as Tickz, that thin record is the most important context, so it is repeated wherever it changes how a point should be read.

One framing point matters for fixed-time trading specifically. Whichever platform a reader picks, the product itself carries a real risk of loss, because a short-duration trade either finishes in the money or it does not. No comparison of features changes that underlying maths, so the safest reading of this page is that the choice is about fit and comfort, not about removing risk.

Both apps share a category, so judge them on the same features while keeping the track-record gap clearly in view.

Platform and Products

Both run on a short-duration, fixed-time model, with Tickz adding CFD-style trades across currencies, commodities, indices and selected crypto pairs. Quotex leans on the same digital-options style that built its established reputation.

At the product level the two overlap heavily. Fixed-time trading, where you predict whether a price will be higher or lower at a set expiry, is the shared core. Tickz layers CFD-style trades on top of that and spans currencies, commodities, indices and a selection of crypto pairs, though the exact tradable list changes and is best checked inside the app. Quotex is widely known for its fixed-time and digital-options focus, backed by a longer operating history and a large community of users.

The table below sets the two side by side on the points most beginners ask about. The Tickz column reflects the approved, verified description of a new and emerging app; the Quotex column reflects only general, widely-known characteristics of an established platform, with no invented figures on either side.

Feature	Tickz	Quotex
Products	Fixed-time and CFD-style trades	Fixed-time and digital-options style
Demo account	Free, virtual-money demo	Free demo account available
Apps	iOS, Android and mobile web (m.tickz.com)	Web platform plus mobile access
Deposit methods	Cards and e-wallets	Cards and e-wallets (varies by region)
Minimum deposit	Low (a small minimum; confirm in-app)	Low entry point (confirm on site)
Withdrawals	Back to the deposit method after KYC	Standard method-based withdrawals
Verification (KYC)	Standard ID, sometimes proof of address, selfie	Standard identity verification
Track record	New and emerging, short public history	Established, longer track record
Best for	Beginners wanting a low-cost mobile start	Traders wanting a more proven brand

The honest read is that on the trading surface itself the experience is close. Where they diverge is maturity: Quotex has years of public use behind it, while Tickz is still building that

history. Neither difference shows up while you place a practice trade, but it matters for how much external evidence you can lean on before committing real money.

It is worth separating two ideas that often get blurred. A shorter track record is not the same as a worse product. Tickz can offer a clean, modern trading surface today while still lacking the years of public use that sit behind Quotex. Both things can be true at once, and a fair comparison holds them together rather than letting newness stand in for low quality.

On the asset side, neither brand should be assumed to carry an identical market list in every country. Tickz spans currencies, commodities, indices and selected crypto pairs, but the exact instruments shift, and regional rules can remove some products entirely. A reader who needs a specific market should confirm it is available in their country on both platforms before deciding the comparison on that basis.

Product-for-product the two are close; the real separation is Quotex maturity against the broader Tickz CFD-style range.

Apps and Usability

Mobile-first design is where the newer app leans hardest. Tickz ships native iOS and Android apps plus a mobile web build, while Quotex grew up around a web platform with mobile access added for its large user base.

Day-to-day usability is the area a beginner notices first, and the two come at it from different roots. Tickz was designed mobile-first, with native apps on the App Store and Android plus a mobile web version at m.tickz.com. That focus tends to show in onboarding flow and one-handed trade placement. Quotex is best known for its browser-based platform, which many established users still prefer for charting on a larger screen, with mobile access available alongside it.

For someone choosing between them, a few usability points carry the most weight:

- **Onboarding:** Tickz registration is free and quick, with live trading gated behind KYC; the demo opens the door before any deposit
- **Demo practice:** both offer virtual-money demos, so a new trader can rehearse the interface risk-free on either
- **App availability:** a given app may or may not appear in a specific country's store, so check your local store listing first
- **Referral and social features:** Tickz promotes referral and social-trading style features, though depth on a young platform should be treated cautiously
- **Screen preference:** Quotex suits traders who like a desktop browser view; Tickz suits those who live on their phone

Neither approach is automatically better. The mobile-first build of Tickz is an advantage for phone-only users and a neutral point for anyone who prefers a wide chart. The maturity of the Quotex platform means more users have stress-tested its interface over time, which is its own kind of reassurance. The fair summary is that usability comes down to device habits more than to one app being objectively smoother than the other.

Support and language coverage feed into usability as well. Tickz offers its interface and help in

multiple languages, including Arabic and Bengali, reflecting an international and emerging-markets focus. That breadth is useful for non-English speakers who want to trade in their own language. Quotex, with its larger and longer-standing base, has had more time to refine support workflows, which is a practical advantage when something goes wrong and a quick answer matters.

Account onboarding deserves one honest caveat on both sides. Opening an account is quick, but reaching live trading means completing identity verification, and that step takes time on any compliant platform. Treating the demo as the place to learn the interface, while KYC runs in the background, is the smoother path on either app and avoids the frustration of waiting to trade.

Pick on device habits: phone-only traders favour the mobile-first build, browser-first traders favour the established web platform.

Money and Trust

Funding looks similar on paper, with cards and e-wallets on both sides and a low entry point. Trust is where maturity tells: Quotex carries a longer history, while Tickz states segregated funds without a long public record to lean on yet.

On the money side the mechanics line up closely. Tickz accepts card and e-wallet deposits, sets a low minimum (commonly described as roughly the low tens of dollars, best confirmed in-app), and routes withdrawals back to the original deposit method once KYC is complete. Processing typically takes from about one to several business days depending on method, verification status and review checks, with weekends or extra checks able to extend that. Quotex similarly offers card and e-wallet funding with a low entry point, varying by region.

Trust is where the two clearly differ, and it is worth being precise about why:

- **Track record:** Quotex has a longer public history and a large existing user base; Tickz is new, with limited long-term evidence either way
- **Funds handling:** Tickz states it holds client money separately from operating funds; treat this as a stated practice, not a guaranteed protection, since its strength depends on the operating entity
- **Licensing:** Tickz operates under an international licensing framework rather than a specifically named top-tier regulator, so verify the current entity and licence on its official site for your country
- **Review base:** independent reviews of Tickz are still sparse and emerging, so any single rating is low-signal; Quotex has a far larger body of public feedback

The candid position is that funding works much the same way on both, but the depth of external evidence does not. A reader who needs the comfort of a long, well-documented history will find Quotex ahead on that single axis. A reader comfortable starting small and verifying details directly may be content with the newer option. Neither funds model removes the underlying risk of losing money on trades.

There is a sensible way to read the trust gap without overstating it. The absence of a long public record for Tickz is a reason to verify and start small, not a finding of wrongdoing. No regulator warning is described here, and standard anti-fraud verification is in place. The honest

position is that less evidence exists, so a cautious reader leans on their own checks rather than on the crowd.

Withdrawals are usually where trust is tested in practice. On Tickz, the most reliable way to avoid a holdup is to complete KYC fully and make sure the payout method matches the deposit method. The same discipline helps on any established platform too. Most delays that get described as blocked withdrawals turn out to be verification steps that had not yet been finished.

Funding is near-identical; the deciding gap is the weight of public trust evidence, which currently favours the older brand.

Verdict: Tickz vs Quotex

Choosing between them comes down to what you value more: a simple, low-cost, mobile-first entry or the reassurance of a longer track record. Both are usable; the right pick depends on your priorities, not on one being a scam.

Neither platform earns a blanket "winner" label, because they answer different needs. Tickz makes most sense for a specific reader, and so does Quotex, depending on what carries the most weight for you.

When Tickz fits

- You want a beginner-friendly, mobile-first app you can run entirely from a phone
- A low minimum deposit and a free demo matter for testing the waters cheaply
- Referral and social-trading style features appeal to you, with realistic expectations for a young platform
- You are comfortable verifying the operating entity and licence yourself before depositing

When Quotex fits

- A longer public track record and a large existing user base are your top priorities
- You prefer a browser-based platform for charting alongside mobile access
- You want the reassurance of a deeper body of public feedback before committing

The fair bottom-line reading is that Tickz is a credible, if young, option whose main limitation is simply time in the market, not a visible red flag. Quotex leads on maturity and the volume of evidence behind it. A sensible path on either is the same: start on the demo, complete KYC early, deposit a small amount first, keep records, and confirm current terms on the official site for your country. Short-duration trading carries a real risk of loss regardless of which brand you choose, so size positions accordingly.

A short word on who should probably wait. Anyone who cannot comfortably afford to lose the amount they would deposit should not rush into either platform, regardless of which looks more appealing. Fixed-time trading is fast and unforgiving, and a free demo exists precisely so that a beginner can build judgement before any money is involved. Using that demo for a meaningful stretch is the single most protective step available on both apps.

For readers still torn, a simple tie-breaker helps. If the deciding factor is the comfort of a long,

well-documented history, that points one way; if it is a cheap, phone-native start with a small first deposit, that points the other. Either decision is defensible, and neither locks a trader in, since trying the demo on both costs nothing but time.

A practical first week looks the same on either app and is worth spelling out. Open the demo and place enough practice trades to understand expiries and position sizing before any real money is involved. Complete identity verification early, so KYC is not a surprise when you want to withdraw later. When ready, deposit a small amount, then make a modest withdrawal to see the payout flow from end to end, keeping records of every deposit, trade and request along the way. That sequence builds real confidence faster than any single review, and it works equally well whether the final pick is Tickz or Quotex. If anything feels unclear at a given step, pausing to ask support before depositing more is always the cheaper choice.

Tickz suits a cheap, mobile-first start; Quotex suits readers who prize a longer record, and demo-first applies to both.

FAQ

Is Tickz or Quotex better for a complete beginner?

For someone who wants the simplest, lowest-cost, phone-only start, Tickz is a reasonable entry point thanks to its mobile-first design, free demo and low minimum deposit. Quotex suits a beginner who would rather start on a more established brand with a longer public track record. Both let you practise on a demo first, which is the safest way to decide.

Is Tickz a scam compared with Quotex?

There is no evidence presented here that Tickz is a scam. It is a new app with a short public history, which is different from being fraudulent. Quotex is simply more established, so more public feedback exists about it. The honest distinction is maturity and evidence volume, not legitimacy.

Which platform has a lower minimum deposit?

Both are positioned as low-cost to start. Tickz is commonly described as having a small minimum deposit in roughly the low tens of dollars, though you should confirm the exact figure in the app. Quotex also offers a low entry point that varies by region. Neither requires a large upfront commitment.

How do withdrawals compare between Tickz and Quotex?

On Tickz, withdrawals generally route back to your original deposit method after KYC is complete, with processing typically taking from about one to several business days depending on method and review checks. Quotex uses standard method-based withdrawals. With both, completing verification fully and matching your deposit and payout details is the main way to avoid delays.

Does Quotex being more established make Tickz unsafe?

No. A longer track record gives Quotex more public evidence behind it, but that does not make a newer app unsafe by default. Tickz uses standard KYC, states it holds client funds separately, and operates under an international licensing framework. The sensible approach with any young platform is to verify the current entity and licence and start small.

Can I use the demo on both before choosing?

Yes. Tickz and Quotex both offer free demo accounts funded with virtual money, so you can rehearse the interface and the fixed-time trading flow on each without risking real funds. Trying both demos side by side is the most reliable way to feel which app suits your device habits and trading style before depositing.
